

Instructions for Using Veggie Pharm Concentrate:

Mixing Instructions:

For Greenhouse Use:

Standard dilution is 1 part Veggie Pharm Concentrate to 8 parts water, dilute further if necessary. PLEASE TEST SEEDLINGS FIRST.

Outdoor Use:

For infestations, mix 1 part Veggie Pharm Concentrate to 6 (see important note below) parts of water. Gently rotate the Veggie Pharm container to mix ingredients before each dilution. If any product is left in your sprayer for the next application, please stir before use. Shelf life is minimum 2 years.

For Best Results:

Please test before full application. Remove diseased leaves and discard in the trash. Avoid tender new leaves and open buds when possible.

Thoroughly hydrate your plants in the AM, late that day, in the evening after the sun has gone down, spray a fine even mist of Veggie Pharm on the stems and top and bottom of leaves. This is a very important step to promote a long drying time, allowing the product to work more effectively. If you have a bad case of Fungus, it is wise to spray the ground around your plants as well. Spores fall to the ground and wait for the wind or water, to lift them up to the leaves. Once the Fungus is under control you can cease the ground spraying. In the case of Powdery Mildew, spray at first sign on affected plants. Repeat weekly. Please do not allow the product to accumulate on curled or cupped leaves, this could cause burning. We suggest shaking the stem to remove excess product.

Be sure to keep your plants free of dead and diseased leaves and discard them. This promotes air circulation which in turn prevents disease. Consider using “Garlic Pharm” between applications to repel pests.

Important Note: Some of our growers have found that mixing 1 part Veggie Pharm to 10 - 14 parts water for outdoor use works very well for them. This all depends on the region you live in and your local weather. Our suggestion is to test different strengths of dilution on affected plants and see what works best in your local.

If you are spraying preventively 14 parts water to 1 part concentrate may work for you.

Please keep very high pressure in your sprayer to avoid over spraying. You should be spraying a fine mist, with little or no soap residue to be seen.

Leaves should be glossy and clean when dry. Thank you.
